

Website setup

Oudkempeneet Eetcafé · oudkempeneetcafe.nl

Before you start

- The website folder we sent you, saved to your Desktop
- Your phone
- Your login for **Key-Systems**, where your domain is registered

1. Create a Cloudflare account

1. Go to `dash.cloudflare.com/sign-up`
2. Enter your email and a password, tick **Verify you are human**, click **Sign up**
3. Open the email from Cloudflare and click the confirmation link
4. Set up two-factor authentication when prompted, using your phone
5. Print the **recovery codes** it shows you and keep them in the café

Without those recovery codes, a lost phone means the account is locked permanently. Nobody can reopen it — not Cloudflare, not us.

2. Upload the website

1. Left menu → **Compute** → **Workers & Pages**
2. **Create application** → **Pages** tab → **Upload assets**
3. Project name:

`oudkempeneet-cafe`

4. Drag in the folder we sent you, then click **Deploy site**
5. Click the `.pages.dev` link and check the site loads

3. Add your domain

1. Click the Cloudflare logo (top left) → **Add a domain**

2. Enter:

```
oudkempeneetcafe.nl
```

3. Choose the **Free** plan

4. On the records screen, check there is a **TXT** record reading `v=spf1 -all`, then click **Continue**

5. **Write down the two nameservers** it gives you — they look like

```
anna.ns.cloudflare.com
```

4. Change the nameservers

1. Log in to Key-Systems, or the reseller you bought the domain from

2. Find the **Nameservers** setting

3. Remove these four:

```
ns-cloud-e1.googledomains.com
```

```
ns-cloud-e2.googledomains.com
```

```
ns-cloud-e3.googledomains.com
```

```
ns-cloud-e4.googledomains.com
```

4. Add the two Cloudflare nameservers from step 3.5

5. Save

Keep this page. Those four values are how you undo everything — see the last section.

5. Connect the domain to the site

1. **Compute** → **Workers & Pages** → **oudkempeneet-cafe**

2. **Custom domains** tab → **Set up a custom domain**

3. Add `oudkempeneetcafe.nl`

4. Repeat for `www.oudkempeneetcafe.nl`

6. Check it works

Wait up to an hour, then confirm all four:

- `https://oudkempeneetcafe.nl` loads, with a padlock
- `https://www.oudkempeneetcafe.nl` loads, with a padlock
- The site looks right on your phone
- A test reservation arrives in your email

Tell us when all four pass. Do not continue to step 7 before that.

7. Cancel Squarespace

1. Squarespace → **Settings** → **Import/Export** → **Export**, and save the file
2. Save any photos from the old site you want to keep
3. Cancel the subscription

8. Updating the site later

1. We email you a new folder
2. **Compute** → **Workers & Pages** → **oudkempeneet-cafe**
3. **Create a new deployment**, drag the folder in

To undo everything

Set your nameservers at Key-Systems back to:

```
ns-cloud-e1.googledomains.com
ns-cloud-e2.googledomains.com
ns-cloud-e3.googledomains.com
ns-cloud-e4.googledomains.com
```

Your site returns to how it was, usually within the hour. This works while the Squarespace subscription is still active.
